Programmable Logic Controller

1

Parameter	Type	Current ...	Pr...	Value	Default ...	Unit	Description
GP104	Enumeration of BYTE	not used		not used	not used		configuration of GP104
GP1017	Enumeration of BYTE	not used		not used	not used		configuration of GP1017
GP1018	Enumeration of BYTE	not used		not used	not used		configuration of GP1018
GP1022	Enumeration of BYTE	Output		Output	not used		configuration of GP1022
GP1023	Enumeration of BYTE	not used		not used	not used		configuration of GP1023
GP1024	Enumeration of BYTE	Input		Input	not used		configuration of GP1024
GP1025	Enumeration of BYTE	not used		not used	not used		configuration of GP1025

Background on Attacks and Defenses in PLCs

- Attacks:
 - Firmware modification attacks
 - Configuration manipulation attacks
 - Control Flow attacks
 - Authentication bypass
- Defenses:
 - Attestation
 - Control flow integrity
 - Firmware integrity verification
 - Logic checksum

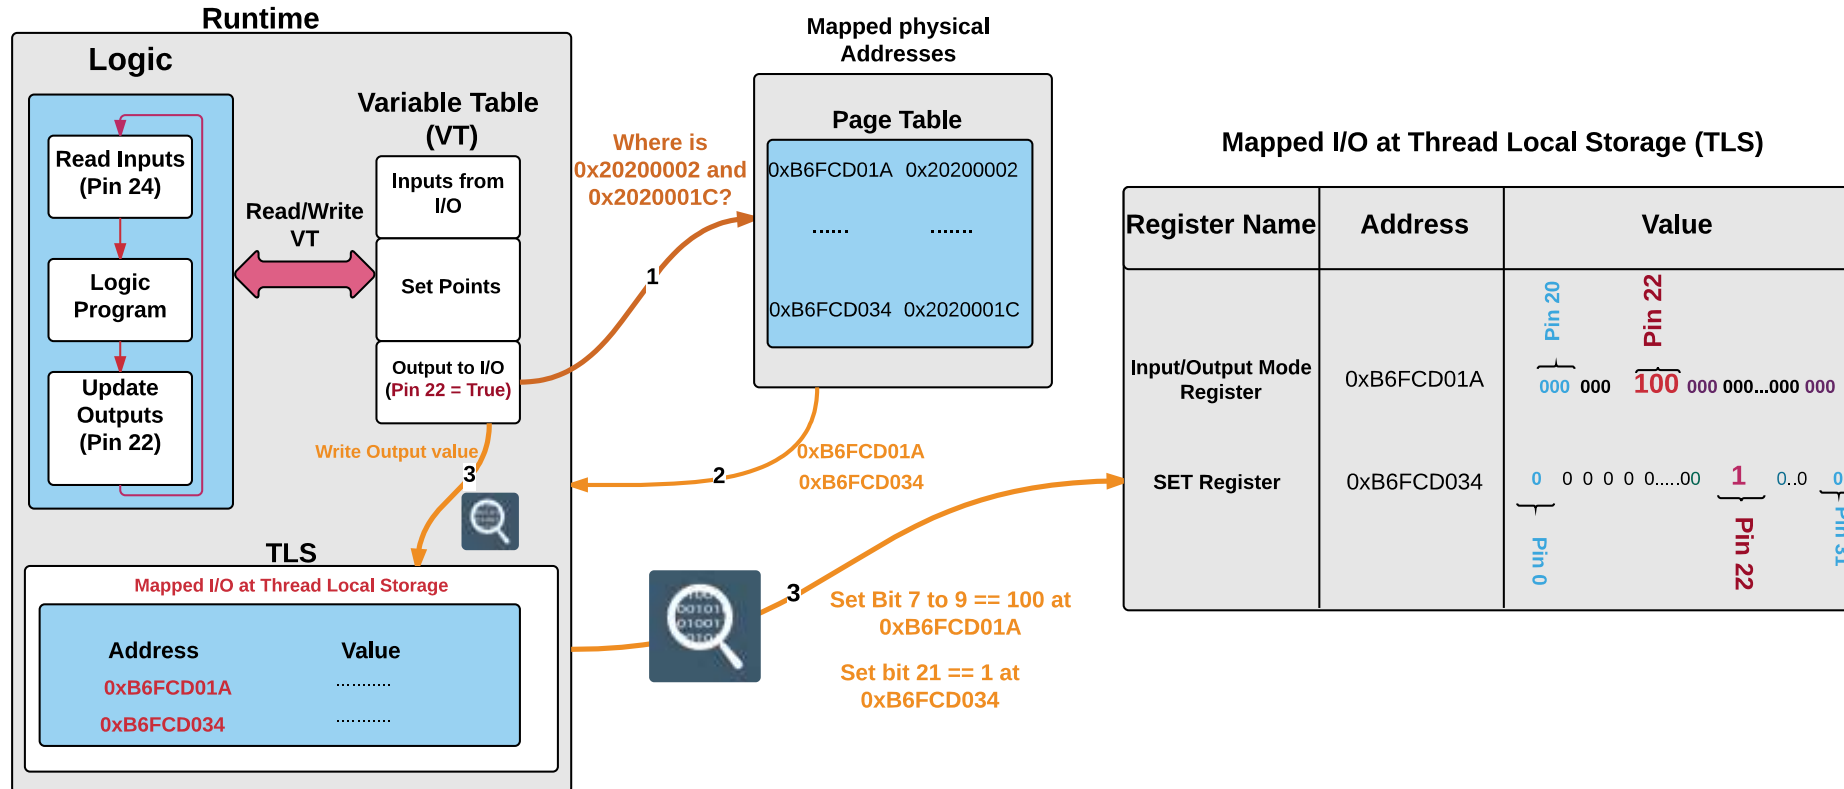

Background on Pin Control

Pin Control Subsystem

- Pin Configuration
- Pin Multiplexing

How PLC Control the I/O

Security concerns regarding Pin Control

No Interrupt for Pin Configuration

How the OS knows about the modification of pin configuration?

What if somebody modify configuration of Pin at runtime?

No Interrupt for Pin Multiplexing

How OS knows about the of pin multiplexing?

What if somebody multiplex a Pin at runtime?

Security Concerns

Request for mapping the physical I/O Memory

Map (I/O Memory, +16bytes)

Operating System/ Kernel

map via MMU

PLC Runtime

Logic

Blink LED every 5 sec in Pin 22 if Pin 24 is True

Pin 24 == Input (bit == 0)

Pin 22 == Output (bit == 1)

Write 0/1 every 5 sec

Read Pin 24

Virtual I/O Memory (mapped)

State Register

Write register

Read register

0 for bit 24
1 for bit 22

0/1

1

State Register

Write register

Read register

0 for bit 24
1 for bit 22

0/1

Physical I/O Memory

Parameter	Type	Current...	Pr...	Value	Default...	Unit	Description
GP104	Enumeration of BYTE	not used		not used	not used		configuration of GP104
GP1017	Enumeration of BYTE	not used		not used	not used		configuration of GP1017
GP1018	Enumeration of BYTE	not used		not used	not used		configuration of GP1018
GP1022	Enumeration of BYTE	Output		Output	not used		configuration of GP1022
GP1023	Enumeration of BYTE	not used		not used	not used		configuration of GP1023
GP1024	Enumeration of BYTE	Input		Input	not used		configuration of GP1024
GP1025	Enumeration of BYTE	not used		not used	not used		configuration of GP1025

Security Concerns

Request for mapping the physical I/O Memory

Map (I/O Memory, +16bytes)

Operating System/ Kernel

map via MMU

PLC Runtime

Logic

Blink LED every 5 sec in Pin 22 if Pin 24 is True

Pin 24 == Input (bit == 0)
Pin 22 == Input (bit == 0)
Pin 22 == Output (bit == 1)

Virtual I/O Memory (mapped)

Write Failure!!
Pin is in Input Mode

Physical I/O Memory

Parameter	Type	Current...	Pr...	Value	Default...	Unit	Description
GP104	Enumeration of BYTE	not used		not used	not used		configuration of GP104
GP1017	Enumeration of BYTE	not used		not used	not used		configuration of GP1017
GP1018	Enumeration of BYTE	not used		not used	not used		configuration of GP1018
GP1022	Enumeration of BYTE	Output		Output	not used		configuration of GP1022
GP1023	Enumeration of BYTE	not used		not used	not used		configuration of GP1023
GP1024	Enumeration of BYTE	Input		Input	not used		configuration of GP1024
GP1025	Enumeration of BYTE	not used		not used	not used		configuration of GP1025

Pin Control Attack

- We can disable write to the PLC I/O outputs
 - Virtual memory have different value since CPU will ignore write operations.
- We can enable write to the PLC input I/O as well.
- Pin Control Attack: manipulate the I/O configuration of the PLC
 - PLC OS never knows about it.

Manipulate Read

1. Find the Reference Starting Time

3. Set Pin to Output Mode (write-enable)

4. Write Desired Value to Output Pin

read(I/O, Pin)

Manipulate Write

1. Find the Reference Starting Time

3. Set Pin to Input (write-ignore)

write() to I/O

3. Set Pin to Output (write-enable)

Write desired value

Pin Control Attack actions

PLC runtime actions

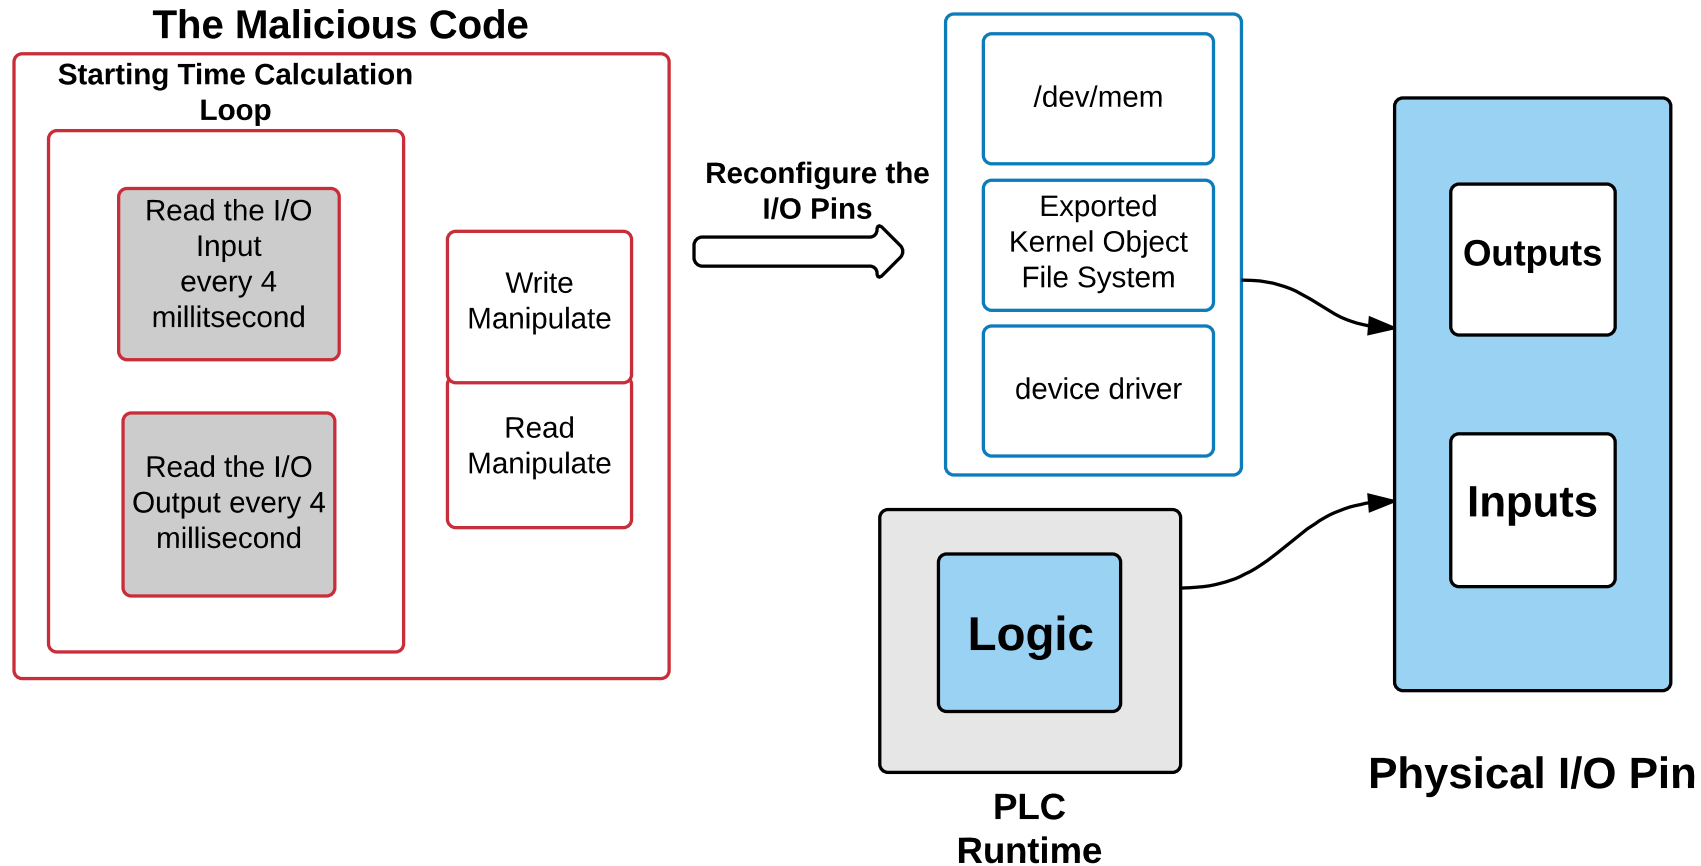

Threat Model & Attack Implementation

- PLC runtime privilege
- Knowledge of the physical process
- Knowledge of mapping between I/O pins and the logic

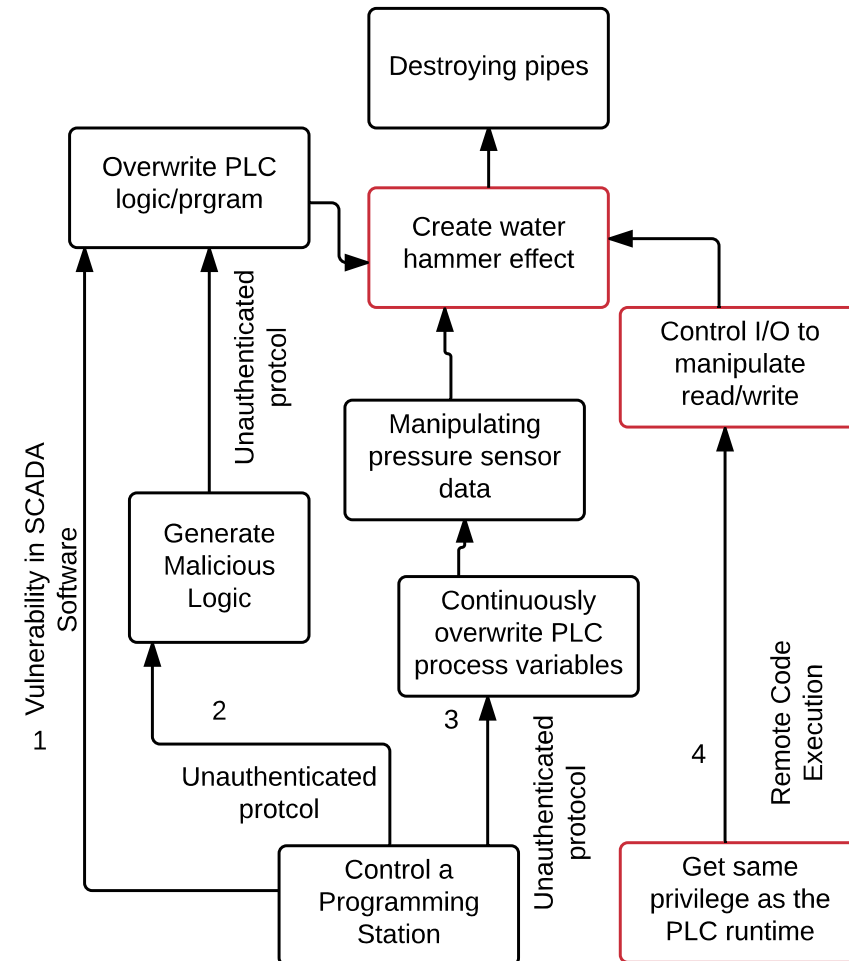

Practical Implementation of the Attack

Implication of the attack on the ICS

- Taxonomy of Utilities
 - Water Utilities
- What can happen?:
 - Attacker can change the I/O
 - PLC is unaware of it.
 - Even if we deploy some kind of detection mechanisms

Implication of Attack in the ICS

- For now attacker can:
 - Simply change the logic
 - Modify PLC Runtime executable
- Fixing this attacks are trivial:
 - Proper Authentication
 - Proper Logic Checksum
 - PLC Runtime integrity verification
- Next Step for attackers:
 - Achieve its goal without actually modifying the Logic or Runtime or hooking functions

Conclusions

- Need to focus on system level security of control devices In future more sophisticated techniques come that evade defenses.
 - Pin Control attack is an example of such attacks.
- Pin Control Attack:
 - lack of interrupt for I/O configuration registers
 - Significant consequences on protected PLCs and other control devices such as IEDs.
- Solution:
- It is hard to handle I/O interrupts with existing real-time constraints.
- Monitoring I/O Configuration Pins for anomalies.
- User/Kernel space separation for I/O memory.
